Discover your genetic disposition to disease – and help ensure you don't fall ill!

Oxy | guard

Dear Client,

Today's medicine enables an insight into your personal genetic disposition.

By knowing your genes, you can avoid harmful environmental conditions and optimize your lifestyle in order not to cross the disease threshold (see figure).

The "Guards" are tests developed for you on the basis of cutting-edge science and technology. The test results reveal your personal risk profile and are the basis for attaining an optimum healthy lifestyle and preventing disease.

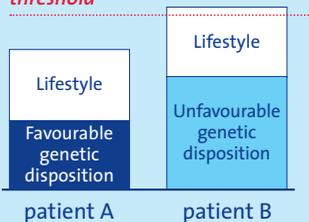

At Bioglobe, we want to help you live a longer and healthier life.

Professor Wolfgang Hoepfner
Bioglobe Laboratory for Molecular Genetics

Increased risk of disease due to a person's genetic disposition

Disease threshold

Due to his genetic position, patient B has to optimize his life style to prevent disease.

Oxy Guard is a genetic test that determines your body's capacity to defend itself against oxygen radicals.

Reactive oxygen species

can cause severe cell damage and are involved in the development of diseases.

They play a pivotal role in

- ageing
- diabetes
- arteriosclerosis
- cancer
- chronic inflammation
- detoxification
- neurodegenerative diseases
- depression
- chemo- and radiotherapy
- macula degeneration
- cataract

A person's anti-oxidative defence varies considerably depending on their individual genetic disposition. If the concentration of oxygen radicals exceeds the body's capacity to neutralize these aggressive molecules, an antioxidant supplement (vitamins, minerals, enzymes, micro-nutrients) becomes necessary to protect cells against damage. Oxy Guard is the basis for deciding which antioxidants in which dosage are suitable for your individual therapy.

A wise investment

Tests for genetic disposition are scientifically founded and make good medical sense. The costs involved in undergoing these tests are a wise investment in the protection of your health.
